The Medeco® DBK Program Puts Biaxial™ Security In Your Hands!

element of Medeco® High Security locking systems. Now Medeco has patented BIAxIAL™ locks – the security industry's new state of the art – for even greater key control. The BIAxIAL lock cylinder operates on a double-locking principle with over *one billion* key combinations and *expanded masterkeying* options. The new BIAxIAL pin tumbler mechanism must be operated by a special key, and each lock has its own unique key.

BIAxIAL locks are ideal for businesses – banks, office buildings, factories, apartment complexes, hospitals, retail stores, schools – and home owners who do not have sole possession of their keys. When you use the new Medeco DBK Program, *only you* can authorize the duplication of your keys.

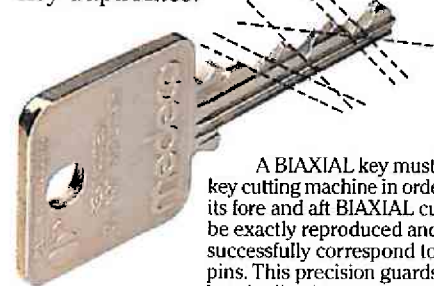

DBK: A Unique, Restricted Key Program

The Medeco DBK program is a exclusive, restricted key security service made available only to select Medeco professional locksmiths and their end user customers. Under this program, a unique key section is assigned by Medeco to each qualified locksmith by means of a contractual agreement. This agreement holds the locksmith responsible for key blank inventory and proper stock of products so that the appointed locksmith and its customers are assured both security and quick turnaround on orders and cut keys.

Each selected locksmith in an assigned territory is the only locksmith within a trading area who can offer this special keyway. To the consumer, this means that no one else is assigned his unique key combination, and in order to have key duplicates cut, he must return to the same locksmith from whom his DBK product was purchased. Under the Medeco contract, this locksmith

must obtain a signature to compare to and verify the purchaser's signature kept on file. This key duplication signature card also helps to maintain the record of key blanks cut, so that the locksmith's inventory can be monitored.

The DBK restricted key program gives Medeco end users the exclusive key control always imperative in security situations, yet affords them the convenience of accessibility of stock and key duplicates.

A BIAxIAL key must be cut on a special key cutting machine in order to precisely duplicate its fore and aft BIAxIAL cuts. The key must be exactly reproduced and dimensioned to successfully correspond to the BIAxIAL tumbler pins. This precision guards against unauthorized key duplication.

Stop!

Before those keys are handed over, think about your security system for a moment. If you keep the only set of keys, your current system is probably adequate. But if employees, parking attendants or anyone with even temporary access to your keys can have them copied *without your authorization*, you may need to reassess your security needs. Your security system isn't a high security system unless *you* can control duplication of *all* your keys.

Key control, along with pick resistance and anti-drill construction, has always been an essential

Authorized Signature

This card is the only document establishing authorization to purchase additional Medeco cut keys and locks of specific assigned codes. Any changes in authorized signatures must be submitted to locksmiths on company letterhead bearing one of the original signatures on this card.
